

Not clear from UML where Memento is created or used for restoring state

Design Pattern Sprint 3: Iterator, AbstractCollectionInventory, InventorySystem, Node, InventoryItem, ConcreteInventorySystem

Classes/interfaces boxes should not be dotted

visibility of Memento should be wider so other classes can hold memento, but not see contents

should be dotted line since realizing interface

these should be dotted lines for realization

other direction

inner class

Should be dotted

use generics

type should be list

use to indicate inner class

COR

The naming of this interface is off it should be a Gradation rather than a factory

shouldn't be returning itself doesn't specify any put for this

Same idea here

Show private constructors for Singleton
